TOTAL AIR TEMPERATURE PROBE PROVIDING IMPROVED ANTI-ICING PERFORMANCE AND REDUCED DEICING HEATER ERROR

ABSTRACT OF THE DISCLOSURE

5 air temperature (TAT) total probe for measuring TAT includes an inlet scoop which receives airflow from free stream airflow moving toward the inlet scoop from a first direction. A first portion of the airflow entering the inlet scoop exits the probe through a main exit channel. A second portion 10 of the airflow enters a TAT sensor flow passage, which extends longitudinally along an axis. This axis is oriented to form an angle of less than 90 degrees. with the first direction from which the free stream airflow toward the inlet scoop. 15 moves Α assembly extends longitudinally in the sensor flow passage and measures a total air temperature of airflow through the sensor flow passage. By increasing the angle through which the internal air turns, better 20 inertial extraction of ice and water particles is realized. As a result, sensor clogging from accreted ice is significantly reduced. A second improvement is achieved by repositioning the sensor element to be more in-line with the internal airflow direction. This helps lower DHE by minimizing heated boundary 25 layer spillage onto the sensing element.
